

Creating MuleSoft CX Video Documentation

This process outlines the steps for MuleSoft CX writers to create standard SME-Demo videos, ensuring quality, consistency, and alignment with company priorities.

MuleSoft CX writers continue to play the primary role in content development by **writing the video scripts** (often with the help of AI tools). Then, they follow a two-path process for SME-Demo videos:

- 1. **Self-Service Production:** The writer/SME can **create, record, and edit the video themselves** using tools like Camtasia or Google Vids, provided they have the necessary experience.
- 2. **Assisted Production:** The writer/SME can **request help** from their dedicated **Cloud QA Video Reviewer** to record and edit the video

Once the video is ready, the writer submits the asset to the QA Reviewer for quality validation and final publication. Finally, the writer embeds the video into their documentation

SME-Demo videos are UI screen captures only, without motion graphics. They are not for in-app use.

Roles and Shared Responsibilities

Role	Primary Responsibilities
SME (Writer /PM)	Owns planning, use case validation, and scripting. May also record and edit the video if they have the experience.
QA Video Reviewer	Reviews the video against all quality standards. May create the video if the SME lacks recording/editing experience. Submits the approved video for publication.
Strategic Services	Provides guidance and support for the program. Publishes approved videos to Vidiyard. Maintains the QA Reviewer spreadsheet and enablement documentation.

Slack Channels

Channel Name	Primary Users	Purpose and Key Actions	Important Notes
#ms-cx-video	MuleSoft CX Writers	Used by MuleSoft CX writers to submit videos for publication/review or to request assistance with creating (recording/editing) new video content.	This is the dedicated channel for MuleSoft writers.
#cx-sme-demo-videos	QA Video Reviewers	Serves as the central hub for the SME Demo Video Program . Used to submit self-created videos for review (reviewed by other QA Reviewers) or to request final video publication .	Primarily used by QA Reviewers for program coordination and publication requests.
#cx-video-help	Other Writers /Clouds	A general central hub for the SME Demo Video Program. Used to ask questions about demo video production, Camtasia editing, and the QA review process.	Do not post requests for video creation here, as the Strategic Services team only focuses on Agentforce-related topics in this channel.

Process Flow

Video Documentation Process Overview

Process Flow: Self-Service vs. Assisted Production

This process is divided into three key phases, with a clear choice for production based on the SME's experience level.

Phase	Goal	Key Action Point
Phase 1: Planning	Validate the Use Case and Finalize the Script.	The SME confirms the video is needed and creates the approved storyboard (optional but very useful) and script.
Phase 2: Production & Editing	Create the Final Video Asset meeting all quality standards.	Option A (Self-Service): SME records and edits the video using Camtasia or Google Vids. Option B (Assisted): SME submits the request to the Cloud QA Video Reviewer in #ms-cx-video to record and edit the video.
Phase 3: Publication	Final Quality Approval and Deployment to Vidyard.	The QA Reviewer completes the final quality check, submits the video for upload, and the final link is provided for embedding.

Phase 1: Planning and Pre-Production

The initial phase focuses on justifying the video, ensuring stability, and preparing the script.

Step	Action	Key Details & Requirements
1. Justify the Video Need	Consult the guide to confirm the content is a good candidate for a video.	Good candidates often include complex, multi-step procedures or concepts hard to explain with text alone. Do not create a video for topics with extensive code, reference material, or features likely to change within 3–6 months.
2. Check for Existing Assets	Verify that a suitable video (e.g., Product Spotlight or training video) does not already exist.	Check locations like https://videos.mulesoft.com/categories/product and https://www.youtube.com/user/mulesoftvids/videos .
3. Ensure Product Stability	Confirm the product or feature is stable and ready for GA or already GA .	Recording should occur after GA to prevent the video from becoming outdated immediately upon release.

4. Create Storyboard & Script	Create a storyboard and write a script using the Video Script template .	Use prompts in Gemini to generate the script draft, adapting it for your MuleSoft feature. The script will be used to generate closed captions, so follow accessibility guidelines. The script /storyboard must be reviewed and approved by stakeholders and CX editors. Prompts: • Video Script from Help Topic • Video Script for Salesforce Go
5. Decide Production Method	Decide whether you will produce the video yourself or request help.	Option A (Self-Produce): If you have Camtasia/Google Vids editing experience, record and edit yourself. Review: • Camtasia: Production Process for SMEs • Google Vids Process Option B (Assisted): If you need help, submit a request to your Cloud QA Video Reviewer in #ms-cx-video, who will record and edit the video for you.
6. Prep Environment (Self-Produce)	If producing yourself, acquire a Camtasia license and download the SME-demo graphic assets library .	The demo org must look like a realistic customer org (no PII, no celebrity names, believable data).

Phase 2: Recording and Editing (SME or QA Reviewer)

If you are self-producing the video, follow these guidelines, preferably using Camtasia or Google Vids. The video must meet all quality standards listed below.

Step	Action	Key Recording and Editing Requirements
1. Set up Visuals & Data	Record the video using Camtasia or Google Vids using the video-only setting.	• Data Integrity (PII): Demo must contain No Personally Identifiable Information (PII) (like real names, emails, or phone numbers) or celebrity names. If PII is unavoidable, it must be masked or blurred. • On-Screen Text: All on-screen text must follow proper spelling, capitalization, and punctuation. • UI Clarity: Use full-screen mode on a high-res screen. Ensure UI components are readable. • Length: Total run time must be 3 minutes or less. • Bumpers: Include standard intro and outro bumpers (from the downloaded library) approved by Marketing. • Playback: Do not have videos repeat automatically.
2. Set up Audio	Record audio separately using an external microphone or use AI voiceover via Google Vids .	• Clarity: Audio must be heard clearly without distracting noises (e.g., constant clicking). • Noise Removal: If background noise is present, use the AI noise removal effect. • Intelligibility: If words are unintelligible, the narrator must re-record, or an AI voiceover must be used. • Music: Do not include music during the voiceover part.
3. Edit and Finalize	Edit the visuals, arranging clips per the storyboard.	• Resolution & Style: Exported video file must be 1920 x1080 resolution. • Black Bars: No black bars; replace empty space with the blue Camtasia background. • Effects: Zooms must be at a reasonable speed. Use fades to transition between cuts where necessary. • Callouts: Use the callouts colors from the downloaded library.
4. Export	Export the final video as an .mp4 file.	If the PII policy is violated, the video might be removed from Vidyard. Check the video against all quality standards after exporting.

Phase 3: Review and Publication

The QA Reviewer is responsible for final quality validation and managing the publication process to the Strategic Services team.

Step	Action	Details / Responsible Party

1. Review & Feedback	Submit the video to your Cloud QA Video Reviewer .	The QA Reviewer uses the QA Reviewer Checklist to validate style, data, audio clarity, and effects. The video must meet all quality standards before it can be uploaded. QA Video Reviewer training
2. Submit for Upload	The QA Video Reviewer submits the final approved video for upload to Vidyard.	This is done using the QA Reviewer Upload Request workflow in the Slack channel #cx-sme-demo-videos. The reviewer also requests closed captions.
3. Upload & Caption	Strategic Services uploads the video to Vidyard and tags the QA Reviewer, writer, and PM with the caption file.	The writer/PM reviews the caption file for accuracy and notifies Strategic Services when ready.
4. Final Embedding	Strategic Services provides the Vidyard link to the QA Reviewer.	Embed the video in your AsciiDoc document. To embed a Vidyard video in AsciiDoc, you must use a separate partial .html file. Review: • Embedding Videos Hosted on Vidyard • Embedding Videos Hosted on YouTube or Vimeo
5. Tracking	Add a link of the video to the Video Needs Audit sheet To get usage metrics, use the CX Video Stats sheet	Analytics on video usage can be viewed on the CX Video Stats sheet . Unfortunately, Vidyard metrics can only be viewed by the Strategic Services team.

Determining Video Content and Priority

Use Case: Deciding What Content Needs a Video

When deciding if a topic requires a video, ask yourself:

"Would a brief demo video make this content easier to understand?"

Video Content Eligibility

Category	Criteria	Candidate Status
Complexity	A concept or procedure is hard to explain or visualize using text alone.	
Procedure Flow	A complex procedure has multiple steps or crosses different products and UIs.	
Length	A topic takes many pages of text to explain, but isn't difficult to grasp.	
Material Type	The topic contains extensive code or reference material.	
Ownership	The content is better suited as a training video (request from Training group).	
Ownership	The content is intended as a marketing video to highlight capabilities and sell the product (request from Marketing group).	

Video Prioritization

Category	Criteria
Adoption	The concept or task is in a new product or one for which MuleSoft is actively trying to increase adoption.
Stability	The feature is stable and not likely to change enough to render the video useless within 3 months, 6 months, or a year.
Usage	The documentation set has high customer usage (measured using Google Analytics and Amplitude).

Embedding Videos Hosted on Vidyard

To embed Vidyard videos, you must use a separate partial HTML file because Vidyard provides an HTML embed code. You can follow one of two processes to obtain the necessary embed code:

Process Option 1: Obtaining the Code Directly from Vidyard

1. Find the video on the MuleSoft videos website (e.g., videos.mulesoft.com), for example [Product Spotlight: API Governance](#)
2. Click the **Embed** button below the video.

3. In the popup, choose the **Inline Embed** tab and copy the provided embed code.

4. Paste the embed code HTML into a new partial file named with an extension of .html. For example, the partial file name for the API Governance video is api-gov-gs-video.html.

```
<script type="text/javascript" async src="https://play.vidyard.com/embed/v4.js">
</script>

<!-- Put this wherever you would like your player to appear -->

```

Include the partial in your doc page using the following format. You must put the ++++ on the lines above and below the include, because the partial is HTML, not ADOC. Otherwise, the code will not resolve properly during the Antora build.

```
++++
```

```
include::_partials/prodname-gs-video.html[]
```

```
++++
```

For example:

Watch the API Governance Product Spotlight video to see a quick overview of API Governance.

```
++++
```

```
include::_partials/api-gov-gs-video.html[]
```

```
++++
```

Example partial and include in the docs-api-governance-documentation repo:

Partial: https://github.com/mulesoft/docs-api-governance-documentation/blob/latest/modules/ROOT/pages/_partials/api-gov-gs-video.html

Page that has the include of the video partial: <https://github.com/mulesoft/docs-api-governance-documentation/blob/latest/modules/ROOT/pages/index.adoc>

Process Option 2: Obtaining the Code using Cursor

1. Copy the direct Vidyard video link (URL).
2. Open your Cursor environment.
3. Use a prompt like, "Generate the AsciiDoc embed code using the HTML for this Vidyard link: [Paste Link Here]."

Cursor will provide the necessary HTML and the correct include:: format for your .adoc page.

Embedding Videos Hosted on YouTube or Vimeo

Unlike Vidyard, videos hosted on YouTube or Vimeo can be embedded directly using the built-in video macro in AsciiDoc. This eliminates the need to create a separate partial file

Platform	Video URL Format	AsciiDoc Macro Format
YouTube	https://www.youtube.com/watch?v=IUooPJjkJOQ	video::IUooPJjkJOQ[youtube]
Vimeo	https://vimeo.com/589310719	video::589310719[vimeo]

Note: Always replace the number in the macro (e.g., IUooPJjkJOQ or 589310719) with the unique ID found in your YouTube or Vimeo video's URL.
