Stakeholders	List all stakeholders who will be part of the final approval (writers, PMs). All stakeholders should be added to the Slack channel

Production can't start until these steps have been taken:

- ☐ Your script has been approved by CX Editorial
- ☐ Action On Screen Column has Accurate and clear instructions
- ☐ Your Test Org is Functional and has presentable data
- ☐ Final Title and Short Description filled out
- ☐ All stakeholders have given feedback on the script

1	Hi there! Today, we're going to talk about protecting Mule App property values in Runtime Fabric through Anypoint Runtime Manager. This is a crucial step for ensuring the security of your application's sensitive information. These protected application values are encrypted and stored in the Anypoint Security Secrets manager.	Slide presentation	
2	Before you begin, make sure you have the prerequisites in place. You need: • An active Anypoint Platform account. • A Mule application. • Access to Runtime Fabric	Slide presentation	
3	ADD PROPERTIES Now, sign into Anypoint Platform and go to Runtime Manager. Under Applications, click your desired Mule application that you want to protect property values. Then, select Manage Application.	Shows the action to log into Anypoint Platform and go to the RTM UI section. Then show the action to add properties and their values.	

	On the Settings page, click the Properties tab. Depending on how many properties you want to protect at once, you can: Click Table view to protect properties one at a time or click Text View to protect multiple properties. For example, click Table View In the New Key field, add a property to protect, for example: environment. Then, in the New Value field, add the value for that property, for example: production. Repeat the same process to add other properties.		
4	PROTECT PROPERTIES VALUES Now, to protect a specific property value, click Protect, and then Protect Value to confirm. Before you proceed, choose from one of these options: If your application has already been deployed, click Apply changes otherwise, click Deploy Application. For our example, we'll click "Apply Changes". And you are done! In the Properties tab, the values for properties that you just protected are now no longer visible to you or any other user.	Shows the action to protect property values.	

5	REPLACE A PROTECTED PROPERTY VALUE After you protect a property value, you can't retrieve it. However, you can replace the protected property value with a new protected value. In the Table View, click the icon next to the protected value that you want to replace. Click the menu icon next to the value and then click Replace protected value. Enter a new value in the field, and then click Apply, and then Apply changes. And you are all set to protect your propertie's values.	Show the action to replaced a protected property value.	
6	Thank you for watching and see you in the next video!	Outro Salesforce Slide.
